Climate and “terroir” of New Zealand wine regions: a GIS perspective

Climate and “terroir” are the two major commonly used set of factors when describing a wine region apart from those relating to “**Cultiva**” or variety. The latter is given the utmost consideration during **site selection** and once the vines are planted and established “**climate and terroir**” become the deterministic factors of grape crop and the consequent wine production annually. In this context, the paper looks at developing a GIS of thematic digital maps along with grape crop/ wine production / wine quality data to analysing the **year-to-year variability** by looking at the **spatial patterns and any correlations between dependent and independent factors**, using **geospatial tools at different scales**, such as **New Zealand wine regions and within a vineyard**. The dependent factors analysed in this instance are grapes **harvested and wine quality** both at a regional scale. The independent factors used in the study are **temperature, soil, elevation and hill shade**. The paper describes the initial results of an integrated data analysis being investigated with the above stated factors using a geographical information system (GIS).

“terroir” and “cultiva”

- A " **terroir** " is a group of vineyards (or even vines) from the **same region**, belonging to a **specific appellation**, and **sharing the same type of soil, weather conditions, grapes and wine making savoir-faire**, which contribute to **give its specific personality** to the wine.

<http://www.terroir-france.com/theclub/meaning.htm>

“Terroir” X “Cultiva”

- Variety
- Clone
- Rootstock
- Soil
- Canopy management
- Terrain
- Pest Pressure
- Disease Pressure
- Climate
 - Rainfall
 - Humidity
 - Sunshine
- Wind speed
- Cluster microclimate
- Seasonal Variation
- Vineyard Practices

Cultivation practices

lfbisson.ucdavis.edu/PPT/VEN124_Sec_I_Lec_01.ppt

+ Wine making => **specific personality**

Each choice in the successive steps of the elaboration of wine has repercussions on the taste and the quality of the wine

- **the terroir**
- **The climate (and the date of harvest)**
- **the grape-variety**
- **the type of container used for fermentation**
- **the temperature - the juice of grape is maintained during fermentation**
- **the fermentation period**
- **the type of container used for maturation**

The screenshot shows a Microsoft Excel spreadsheet titled "Veineyards_clustering_all.xls [Compatibility Mode] - Microsoft Excel". The data is organized into columns labeled A through L. Column A is "GridNo", column B is "R_VII_X", column C is "Y", and column D is "R_WA_BA_RA_RA_PART_S". Columns E through L contain numerical values representing various environmental variables: RA_SLOPE, WATER_DEF, R_ELEVATIO, FEATURE_MI, ANNUAL_SOL, and F_DRAINAGE. The data spans from row 1 to row 26. The Excel ribbon at the top includes tabs for File, Home, Insert, Page Layout, Formulas, Data, Review, View, and Team. The Home tab is selected, showing standard toolbar icons for font, alignment, and number formats.

conclusions

- Climate and “terroir “ of NZ wine regions are very unique and can be defined.
- Of the variable studied:
 - @ the regional scale and within regions
 - water deficiency
 - elevation
 - soil particle
 - water balance
 - Temperature min

The methodology showed potential

Further analysis required to exactly define NZ “terroirs”
